Anisomorpha buprestoides

Range: North America (southeastern)

Habitat: Arid, sandy or vegetative areas

Diet: Leafy plants such as oak, willow, rosemary etc.

Ecological Role: Herbivore

Lifespan: 10-12 months

Two-Striped Walking Sticks **Fun Facts!** *Anisomorpha buprestoides*

They are commonly found in the wild in pairs!

They can shoot a noxious fluid from two holes on the front of their head, extremely accurately from up to 1.5 feet away!

If the fluid gets in your eyes, intense burning and sensitivity to light will occur for 5 days!

Eggs are buried in the ground which is different from other walking sticks that simply drop their eggs out of trees!
